1. Introduction

Tetrazoles are heterocyclic, five-membered rings containing four nitrogens and one carbon atom (CN_4H_2) [1]. Presence of four nitrogen atoms makes them acidic. They undergo electrophilic as well as nucleophilic substitution [2]. They can act as pharmacophore for the carboxylate group, which increases their utility. Tetrazoles are Angiotensin II blockers as in Losartan and Candesartan [1,3,4]. Tetrazoles and its derivatives show most promising biological activities like antibacterial, antiviral, antifungal, anticonvulsant, antitumor, antihypertensive, antidiabetic, and antiproliferative activities [5-16]. They are cyclooxygenase inhibitors and therefore exhibit analgesic, anti-inflammatory activities [4,17].

It was observed that several highly mutagenic and carcinogenic quinoxalines have been found in heated meat and fried fish. Some of the quinoxaline derivatives have been identified as mild hypolipidemic agents and used for treating pain, epilepsy and other neurodegenerative disorders. Due to DNA binding properties of quinoxalines, they show highest activity against the herpes virus.

They are part of well-known antibiotics such as levomycin, echinomycin, and actinomycin that are known to inhibit growth of gram positive bacteria. Quinoxalines show various biological activities such as anti-viral, anti-depressant and as kinase inhibitors. They are active against transplantable tumors.

Fusion of tetrazole with quinoxalinic acid considered as planar acidic heterocyclic analogue of carboxylic function, which has the ability to increase potency and enhance bioavailability [18,19].

1,3,4-Oxadiazole is a neutral aromatic molecule which is thermally stable [20]. Quinoxalines containing 1,3,4-oxadiazole have been shown to possess a broad biological activity spectrum including antibacterial, antifungal, antiviral, anticancer, antihypertensive, anticonvulsant and anti-diabetic properties [20,21].
Quinoxalines when fused with oxadiazole moiety was also identified as a Selective inhibitor of Guanylyl Cyclase (SGC) and important heme-site inhibitors for nitric oxide donor bioactivation. Moreover, the combined presence of quinoxaline and 1,3-4-oxadiazole in one frame are expected to show promising anti-inflammatory, analgesic and anticonvulsant activities.

Taking into account the importance of quinoxalines, tetrazoles and 1,3,4-oxadiazoles to both medicinal and biological activities, and the potential for bioactivation. Moreover, the combined presence of quinoxaline and 1,3-4-oxadiazole in one frame are expected to show promising anti-inflammatory, analgesic and anticonvulsant activities.

2. Experimental

2.1. Instrumentations and reagents

All chemicals and reagents were of analytical grade and purchased from Merck. Solvents were used in purified form. For thin-layer chromatography (TLC) E. Merck AL silica gel 60F254 plates were used and spots were visualized under UV light. Melting points were determined by using Mel-temp apparatus and are uncorrected. IR spectra were recorded on Perkin Elmer (FT-IR) spectrometer. Only intense peaks are diagnosed and reported. 1H NMR spectra were recorded using Varian NMR-400 MHz instrument. All the chemical shifts were reported in ppm using TMS as an internal standard. Signals are indicated as s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet), br (broad); and coupling constants in Hz. Mass spectra were recorded with a PESiex model API 3000 mass spectrometer. All the reactions were carried out under the atmosphere of an inert gas, argon.

2.2. Synthesis

2.2.1. Synthesis of ethyl-2-(2-methylquinoxalin-3-yloxy) acetate (2)

3-Methyl quinoxalin-2-ol (0.01 mmol) was dissolved in ethanol (15 mL). To this solution ethylchloroacetate (0.01 mmol) and dry potassium carbonate (3 g) were added and refluxed at 80 °C for overnight. After the completion of reaction (monitored by TLC), the mixture was poured into ice cold water and filtered to separate the solid. The product was recrystallized from methanol (Scheme 1). Color: Yellow. Yield: 76%. M.p.: 196-198 °C. FT-IR (KBr, ν, cm⁻¹): 3532 (NH), 3011 (C-H), 1722 (C=O). 1H NMR (400 MHz, CDCl₃, δ, ppm): 7.80 (m, 2H, Ar-H), 7.68 (m, 2H, Ar-H), 5.21 (s, 2H, O-CH₂-C), 4.23 (q, 2H, O-CH₂-C), 2.30 (s, 3H, N=CH-CH₃), 1.23 (t, 3H, O-CH₂-C). MS [EI, m/z (%)]: 246.1 (M+H).

2.2.2. Synthesis of 2-(2-methylquinoxalin-3-yloxy) acetohydrazide (3)

To a solution of ethyl 2-(2-methylquinoxalin-3-yloxy) acetate (2) (0.01 mmol) in ethanol, was added hydrazine hydrate (99%, 20 mL) and refluxed for 5 h on a water bath at 80-90 °C. The reaction mixture was cooled and poured into crushed ice with stirring and kept aside for 30 min for the precipitate to settle. The resultant precipitate was washed, washed with water, dried and recrystallized from ethanol (Scheme 1). Color: Brown. Yield: 81%. M.p.: 204-206 °C. FT-IR (KBr, ν, cm⁻¹): 3532 (NH) 3011 (C-H) 1722 (C=O). 1H NMR (400 MHz, DMSO-d₆, δ, ppm): 8.31 (d, 2H, Ar-H), 8.18 (d, 2H, Ar-H), 7.40 (brs, 1H, NH), 5.20 (s, 2H, O-CH₂-C), 4.70 (brs, 2H, NH₂), 2.31 (s, 3H, CH₃). MS [EI, m/z (%)]: 232.1 (M+H)
2.2.3. Synthesis of N′-Aryliden-2-((3-methylquinoxalin-2-yl)oxy)acetohydrazides (4a-h)

A mixture of 2-(2-methylquinolin-3-yl)oxy)acetohydrazide (3) (0.01 mmol) and aldehyde (0.01 mmol) were dissolved in 25 mL of DMF and 2 mL of glacial acetic acid was added. This mixture was refluxed for 3h. After the completion of the reaction (monitored by TLC), reaction mixture was poured into crushed ice. Solid product thus obtained was filtered, washed with water and recrystallized from ethanol (Scheme 1).

N′-Benzylidene-2-((3-methylquinolin-2-yl)oxy)acetohydrazide (4a): Color: Brown. Yield: 76%. M.p.: 202-204 °C. FT-IR (KBr, ν/cm⁻¹): 3432 (NH), 3035 (C-H) 1718 (C=O). 1H NMR (400 MHz, DMSO-d₆, δ ppm): 8.21 (brs, 1H, NH), 8.11 (s, 1H, N=CH), 7.91 (m, 2H, Ar-H), 7.79 (m, 2H, Ar-H), 7.30 (m, 3H, Ar-H), 7.27 (m, 2H, Ar-H), 5.21 (s, 2H, O-CH₂), 3.80 (s, 3H, CH₃). 13C NMR (100 MHz, DMSO-d₆, δ ppm): 168.2, 140.8, 138.9, 135.4, 135.3, 132.0, 130.9, 129.2, 128.2, 126.4, 124.6, 123.5, 118.1, 70.5, 23.5. MS (EI, m/z (%)): 337 (M⁺).

N′-(4-Fluorobenzylidene)-2-((3-methylquinolin-2-yl)oxy)acetohydrazide (4b): Color: White. Yield: 82%. M.p.: 204-206 °C. 1H NMR (400 MHz, DMSO-d₆, δ ppm): 8.25 (brs, 1H, NH), 8.10 (s, 1H, N=CH), 7.90 (m, 2H, Ar-H), 7.80 (m, 2H, Ar-H), 7.31 (m, 2H, Ar-H), 7.26 (m, 2H, Ar-H), 5.22 (s, 2H, O-CH₂), 3.65 (s, 3H, CH₃). MS (EI, m/z (%)): 339 (M⁺+). 13C NMR (100 MHz, DMSO-d₆, δ ppm): 168.3, 140.9, 139.1, 135.8, 135.5, 132.4, 130.1, 128.1, 128.1, 126.4, 124.5, 123.8, 118.6, 70.8, 67.6, 23.2. MS (EI, m/z (%)): 339 (M⁺+).

2.2.4. Synthesis of 2-((3-methylquinolin-2-yl)oxy) methyl)-5-aryl-1,3,4-oxadiazole (5a-h)

A solution of N′-arylidene-2-((3-methylquinolin-2-yl)oxy)acetohydrazide (0.01 mmol) and chloramine-T (0.05 mmol) in ethanol (25 mL) was refluxed for 5h on a water bath at 80-90 °C. The reaction mixture was cooled and poured into crushed ice with stirring and kept aside for 30min for the precipitate to settle down. The resultant precipitate was filtered, washed with water, dried and recrystallized from ethanol (Scheme 1).

2-(3-Fluoro phenyl)-1,3,4-oxadiazol-2-yl)methoxymethyl quinoxaline (5b): Color: Yellow. Yield: 78%. M.p.: 202-204 °C. 1H NMR (400 MHz, DMSO-d₆, δ ppm): 7.91 (m, 1H, Ar-H), 7.81 (m, 3H, Ar-H), 7.62 (m, 2H, Ar-H), 7.42 (m, 2H, Ar-H), 7.30 (m, 1H, Ar-H), 5.38 (s, 2H, O-CH₂), 2.31 (s, 3H, CH₃). 13C NMR (100 MHz, DMSO-d₆, δ ppm): 168.2, 140.8, 138.9, 135.4, 135.2, 132.1, 132.0, 130.1, 128.3, 128.1, 126.4, 124.5, 123.6, 118.1, 70.6, 22.3. MS (EI, m/z (%)): 337 (M⁺+).
2.2.5. Synthesis of 3-methylquinoxalin-2-yl-2-(5-aryl-2H-tetrazol-2-yl)acetate (6a-h)

A round-bottom flask equipped with a magnetic stirrer was charged with aryllactone (0.14 mmol) and acetone (25 mL). The suspension was cooled to 0 °C before adding anhydrous potassium carbonate. After stirring for 30 minutes at 0 °C 3-methylquinoxalin-2-yl-2-bromacetate (0.16 mmol) was added to the opaque mixture. The reaction was stirred for 16 h while slowly warming to room temperature. The mixture was filtered and thoroughly washed with additional acetone.

The clear filtrate was concentrated under reduced pressure to give solid (Scheme 1).

### 2.2.6. Anti-bacterial activity

Agar well diffusion method was used to determine the anti-microbial activity of synthesized compounds, 2-(5-aryl-1,3,4-oxadiazol-2-yl)methoxy)-3-methyl quinoxalines and 3-methylquinoxalin-2-yl-2-(5-aryl-2H-tetrazol-2-yl)acetates. All the compounds were tested against Gram positive strains (Staphylococcus aureus (ATCC 12598) and Bacillus subtilis (ATCC 6633)) and Gram negative strains (Escherichia coli (ATCC 25922), Pseudomonas aeruginosa (ATCC 27853)) and standard anti-bacterial drug Gentamycin is used as reference drug (Table 1).
3. Results and discussions

Taking into account the importance of quinoxalines, tetrazoles and 1,3,4-oxadiazoles to both medicinal and heterocyclic chemistry, 2-((5-aryl-1,3,4-oxadiazol-2-yl)methoxy)-3-methyl quinoxaline and 3-methylquinoxalin-2-yl-2-(5-aryl-2H-tetrazol-2-yl)acetate derivatives are synthesized from N-Arylidene-2-((3-methylquinoxalin-2-yl)oxy)acetohydrazide. The structures of the synthesized compounds were confirmed by 1H NMR, 13C NMR and Mass spectral data. They have been screened for their antibacterial activity against four pathogenic strains.

The screening results of antibacterial activity of 1,3,4-oxadiazole and tetrazole derivatives 6a-f and 6a-f are summarized in Table 1. Compounds 5c, 6d and 6g show moderate activity in the range of 20-24 mm against S. aureus. Compounds 5f and 6h exhibit moderate activity against B. subtilis. Compounds 5c and 6f against E. coli and compounds 5c and 6h against P. aeruginosa. Compounds 5f, 6d and 6g exhibit excellent activity in the range of 25-28 mm against P. aeruginosa. Compound 6e shows appreciable activity against B. subtilis.

4. Conclusion

Herein we reported the synthesis of some new, 2-((5-aryl-1,3,4-oxadiazol-2-yl)methoxy)-3-methyl quinoxaline and 3-methylquinoxalin-2-yl-2-(5-aryl-2H-tetrazol-2-yl)acetate derivatives and recorded their antibacterial activity.
