#### Abstract

A series of new molecules having 3-(substituted)-4,5,6,7-tetrahydro-6-(substituted)-1 H -pyrazolo[3,4-c]pyridine and 3-(substituted)-5,6-dihydro-6-(substituted)-1 H -pyrazolo[3,4-c] pyridin- $7(4 H)$-one derivatives were designed and synthesized in large scale (grams range). The structures of the synthesized compounds were elucidated and confirmed by ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, Mass spectra; and purity was also checked through LC/MS and HPLC analysis. The antiproliferative activity of the compounds was checked for lung cancer, cervical cancer, breast cancer and prostate cancer on panel of four cell lines. A few compounds (13c, 13g, 15g and 15 h ) showed promising antiproliferative activity in the range of $5.12-17.12 \mu \mathrm{M}$ which were further tested for their inhibitory activity against panel of 8 human kinases at $10 \mu \mathrm{M}$ concentrations. The compounds $13 \mathrm{c}, 13 \mathrm{~g}, 15 \mathrm{~g}$ and 15 h shows prominent inhibitory activity against Aurora-A, Aurora-B, $\mathrm{CDK}_{5} / \mathrm{P}_{25}$ and mTOR kinases.

## 1. Introduction

Cancer treatment is difficult due to plethora of unwanted side effects [1]. In present study, we have chosen 4,5,6,7-tetrahydro- 1 H -pyrazolo $[3,4-c$ ]pyridine and 5,6 -dihydro- 1 H -pyrazolo[3,4-c]pyridin- $7(4 H)$-one as core structure as $4,5,6,7-$ tetrahydro- 1 H -pyrazolo[3,4-c]pyridine is showing diversified biological activities as anticancer activity [2], $5-\mathrm{HT}_{6}$ inhibitors for pain treatment [3], inflammatory disorders [4], GnRH receptor antagonists [5], kinase ${ }_{1}$ inhibitors [6], cannabinoid receptors [7], inhibitor of blood coagulation factor Xa [8], PDE 4 inhibitor [9], COX-2 inhibitors [10], antimicrobial [11] and P13K inhibitors [12]. The pyrazole is known for adenine mimetic pharmacophore and is useful in inhibitors of several classes of kinases like Aurora, CDK-2 and MAP kinases as these plays key role in drug discovery [2]. The tetrahydro- 1 H pyrazole and their derivatives show diversifying activity. By considering their biological importance herein we report the synthesis of 3-(substituted)-4,5,6,7-tetrahydro-6-(substitu-ted)- 1 H -pyrazolo $[3,4-c$ ]pyridine and 3 -(substituted)-5,6-di hydro-6-(substituted)-1H-pyrazolo[3, 4-c] pyridin-7(4H)-one and anticancer activity in cell line along with kinase inhibition study. We have optimized routes for their synthesis. The
synthetic methods adopted for the preparation of the title compounds 13a-h and 15a-h are depicted in Schemes 1 and 2 presented below.

## 2. Experimental

### 2.1. Reagent and instrumentation

All chemicals, unless otherwise specified, were purchased from commercial sources and were used without further purification. The major chemicals were purchased from Sigma Aldrich and Avra Labs. The development of reactions was monitored by thin layer chromatography (TLC) analysis on Merck pre-coated silica gel $60 \mathrm{~F}_{254}$ aluminum sheets, visualized by UV light. All reactions were carried out under argon inert atmosphere. Melting points were recorded on SRS OptiMelt. The purity of intermediates was pursued by TLC, NMR, and LCMS. All final compounds and intermediates are characterized by NMR, LC-MS and purity of final compounds pursued by HPLC and all structures are consistent with proposed structures characterization. The ${ }^{1} \mathrm{H}$ NMR spectra were recorded on Varian NMR ( 400 MHz ) spectrometer. The ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Varian NMR ( 100 MHz ) spectrometer.

### 2.2.12. General procedure for synthesis of compound 13a-h, Step (I)

To a stirred solution of compounds $\mathbf{1 2 a} \mathbf{- h}(1 \mathrm{mmol})$ was dissolved in 2 N dioxane in $\mathrm{HCl}(10 \mathrm{~mL})$ and stirred reaction mixture to room temperature for 6 h . Progress of reaction was monitored by LC-MS for the consumption of starting material. After completion the reaction, the reaction mixture evaporated under reduced pressure to obtain yellow gummy material. The crude obtained was washed with $10 \%$ ethyl acetate:hexane, hexane and diethyl ether to obtain crude 13a-h as yellow solid material. The crude was purified by column chromatography (silica gel, 230-400 mesh) by using 25-75\% ethyl acetate and hexane to obtain desired compounds 13a-h as solid materials.

To a stirred solution of compounds 12a-h (1 mmol) was dissolved in DCM ( 10 mL ). Then added $\mathrm{KMnO}_{4}$ (2 equiv.) and 18-crown-6 ( 0.5 equiv.) and stirred reaction mixture to room temperature for 6 h . Progress of reaction was monitored by LC-MS for the consumption of starting material. After completion the reaction, the reaction mixture was diluted with DCM

Separated and collected the organic layer, washed it with 5 mL of brine and dried organic layer over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated it under reduced pressure to obtain crude compounds $\mathbf{1 4 a}-\mathrm{h}$ as semisolid compound. The crude obtained was washed with 5\% ethyl acetate: hexane, hexane and diethyl ether to obtain yellow semisolid compound. The obtained compound was crystallized by using cold pentane and cold diethyl ether to obtain solid compounds 14a-h.

### 2.2.14. General procedure for synthesis of compounds $15 a$ h, Step (b)

To a stirred solution of compounds $\mathbf{1 4 a} \mathbf{- h}(1 \mathrm{mmol})$ was dissolved in 2 N dioxane in $\mathrm{HCl}(10 \mathrm{~mL})$ and stirred reaction mixture to room temperature for 6 h . Progress of reaction was monitored by LC-MS for the consumption of starting material. After completion the reaction, the reaction mixture evaporated under reduced pressure to obtain yellow gummy material. The obtained crude was washed with $10 \%$ ethyl acetate: hexane, hexane and diethyl ether to obtain crude 15a-h as yellow solid material. The obtained compound was purified by column chromatography by using silica gel (230-400 mesh) by using $25-75 \%$ ethyl acetate and hexane to obtain desired compound 15a-h as solid materials.

The anticancer activity test is performed according to the proce-dure developed by the National Cancer Institute (NCI, USA) in the 'In vitro Anticancer Drug Discovery Screen' that uses the protein-binding dye Sulforhodamine B (SRB) to assess cell growth [14,15]. Briefly, cells are grown in 96 -well plates in suspension and then exposed for 48 hours to four serial concentrations of $1 \times 10^{-7}, 1 \times 10^{-6}, 1 \times 10^{-5}, 1 \times 10^{-4}$ and $1 \times 10^{-3} \mathrm{M}$ of each compound. Cells were fixed and stained with protein binding SRB stain. Excess stain is washed and bound stain was solubilized, and the absorbance was measured at 492 nm in a plate reader. Concentration of the compounds that inhibited $50 \%$ of the net cell growth, growth inhibition of 50\% ( $\mathrm{GI}_{50}$ ), was calculated from the dose response curve obtained for each test compound and cell line. GI50 values were presented in micro molar ( $\mu \mathrm{M}$ ) concentration. Doxorubicin was used as positive control for the comparison of cytotoxicity of synthesized compounds. Assays were performed in triplicate on three independent experiments and their mean values are taken as a final reading. The result of this study indicates that compound $\mathbf{1 3 c}, \mathbf{1 3 g}, \mathbf{1 5 g}$ and $\mathbf{1 5 h}$ shows prominent anticancer activity in all cell lines, having growth inhibition of 50 ( $\mathrm{GI}_{50}$ ) values of 5.12 to $17.52 \mu \mathrm{M}$ (Table 1). All experiments were performed in duplicate and repeated three times.

## 3. Results and discussion

### 3.1. Chemistry

In Scheme 1, Step (a) is enamine formation which is done by reacting compound $\mathbf{1}$ with DMF-DMA heating at $100^{\circ} \mathrm{C}$ for obtaining compound 2 with $78 \%$ yield. The compound 2 is reacted with $\mathrm{N}_{2} \mathrm{H}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$ in EtOH at $80{ }^{\circ} \mathrm{C}$ for 8 h to obtain compound $\mathbf{3}$ with having $68.3 \%$ yield. The structure of $4,5,6,7-$ tetrahydro- 1 H -pyrazolo [4,3-c] pyridine is confirmed by singlet at $\delta 7.31 \mathrm{ppm}$ in ${ }^{1} \mathrm{H}$ NMR [16]. Purification of the compound 3 required purification by using column chromatography. The overall yield obtained by this method is greater than earlier reports [13]. 4,5,6,7-Tetrahydro-1 H -pyrazolo [4,3-c] pyridine (3) is reacted with di-tert-butyl dicarbonate (Boc anhydride) using triethylamine as base to obtain di-tert-butyl-4,5-di hydro-7 H -pyrazolo[3,4-c]pyridine-1,6-dicarboxylate (4) with yield $91 \%$. The compound $\mathbf{4}$ is having BOC protection on both nitrogen's confirmed by ${ }^{1} \mathrm{H}$ NMR showing singlet for 18 H at $\delta$ 1.56 ppm. The Step (d) is deportation of aliphatic N-BOC which is achieved by treating compound 4 with 2 N HCl for 2 h to obtain compound $\mathbf{5}$, confirmed by ${ }^{1} \mathrm{H}$ NMR showing singlet for

9 H at $\delta 1.56 \mathrm{ppm}$. The compound $\mathbf{5}$ was treated with pyridine $\mathrm{Br}_{2}$ at room temperature for 3 h to obtain compound $\mathbf{6}$ with $92 \%$ yield. The structure of tert-butyl-3-bromo-4,5,6,7-tetra hydropyrazolo $[3,4-c]$ pyridine-1-carboxylate (6) was confirmed by disappearance of singlet at $\delta 7.31 \mathrm{ppm}$ in ${ }^{1} \mathrm{H}$ NMR. The compound 6 reacted with aqueous NaOH in heating for 3 h . There is formation of compound 7 in $88.4 \%$ yield which is confirmed by desired mass in LC-MS. The compound 7 is protected by using benzylbromide in THF by using mixture of bases as 2,6 -leutidine and DMAP at room temperature for compound 6 h to obtain compound $\mathbf{8}$ with $83 \%$ yield, with ${ }^{1} \mathrm{H}$ NMR signals at $\delta 7.38-7.28 \mathrm{ppm}(\mathrm{m}, 5 \mathrm{H})$. The compound 8 having free hydroxyl group which is protected by using triflic anhydride at room temperature for 12 h to obtain compound 9 with $88.5 \%$ yield. $t$-Butyl 3 -(2,2,2-trifluoroacetoyloxy)-6-benzyl-4,5,6,7-tetrahydropyrazolo[3, 4-c]pyridine-1-carboxylate ( 9 ) is key intermediate for the synthesis of final compounds 13a-h and 15a-h. The compound 9 was treated with different aromatic boranic acids at $100^{\circ} \mathrm{C}$ for 6 h to obtain compounds 10a-d with yields in the range from 63 to $83 \%$ yields after purifications by silica gel (100-200 mesh) column chromatography. Debenzylation of compounds 10a-d was done by using Pd/C in EtOH for 50 psi of hydrogen for 3 h at room temperature to obtain compounds 11a-d with 84 to $90 \%$ yields. Alkylation of compounds 11a-d was done by using substituted aromatic bromides in THF by using mixed bases 2,6-leutidine and DMAP for 3 h at room temperature to obtain compounds 12a-h with yields 84 to $93 \%$. The cleavage of protecting group of compounds 12a-h was done by using aqueous 6 N HCl at room temperature for 6 h to obtain compounds 13a-h with yields 76 to $91 \%$. The mixed bases used in Steps ( g ) and ( k ) to enhance the reactivity of secondary amine used for reaction.

In Scheme 2, compounds 12a-h are treated with $\mathrm{KMnO}_{4}$ in DCM and 18 -crown- 6 used as phase transfer catalyst at room temperature for 6 h to give compounds 14a-h with yields 71 to $78 \%$, which is confirmed by vanishing singlet at 3.78 in ${ }^{1} \mathrm{H}$ NMR. From cell line data compounds $\mathbf{1 3 c}, \mathbf{1 3 g}, \mathbf{1 5 g}$ and $\mathbf{1 5 h}$ are most active which are having pyrimidine-2-yl group and quinoline3/5-yl groups, compared with compounds having 3-methoxy phenyl, benzofuran and benzothiophene groups. The compound 13c is more active than compound 13d as both of these compounds are separated by position of nitrogen in the qunioline ring, the 3-methoxy compounds with benzofuran and benzothiophene are less active than compounds having pyrimidine-2-yl substitutions. Interestingly compounds having substituted 4,5,6,7-tetrahydro group and substituted 5,6-dihydro groups are moderate to active on all four cell lines and that substituted 5,6-dihydro groups are more active than that of substituted 4,5,6,7-tetrahydro group. These are results from both series of compounds. There is not much difference in their inhibitions in all four cancer cell lines. Further we have studied the most active compounds 13c, 13g, 15g and 15h on human kinases

The compounds $\mathbf{1 3 c}, \mathbf{1 3 g}, \mathbf{1 5 g}$ and $\mathbf{1 5 h}$ are most active in cell line studies, so further we have tested for its activity against a panel of eight human kinase at $10 \mu \mathrm{M}$ concentrations. For Aurora-A kinase compounds, they shows 73, 64, 51 and 57\% inhibitions, respectively. The results are summarized in Table 2. For Aurora-B kinase, compound 13c shows $41 \%$ inhibitions and for remaining compounds 13g (70\%), 15g (77\%) and 15h (73\%) inhibitions. For CDK/cyclinA, CDK/cyclinE, EGFR and PDK1, the inhibition is in the range of 17 to $37 \%$. $\mathrm{CDK}_{5} / \mathrm{P}_{25}$ kinase and mTOR kinase the inhibitions are in the range of 44 to $70 \%$. For Aurora-A, Aurora-B, CDK5/ $\mathrm{P}_{25}$ and
mTOR kinase, all the compounds shows promising inhibitions to great extent. The inhibition results shows compound 13c is active for aurora-A kinase and CDK5/P25 kinase and it shows less inhibition for remaining kinases. Compounds 13g, 15g and $\mathbf{1 5 h}$ shows $>50 \%$ inhibitions. For EGFR, PDK1, CDK2/ cyclinE and $\mathrm{CDK}_{2}$ /cyclinA kinases, most of compounds shows $<40 \%$ inhibitions.

## 4. Conclusion

We have synthesized 3-(substituted)-4,5,6,7-tetrahydro-6-(substituted)-1H-pyrazolo[3, 4-c]pyridine (13a-h) and 3-( substituted)-5, 6-dihydro-6-(substituted)-1H-pyrazolo[3, 4-c] pyridin-7(4H)-one (15a-h). The synthesis mainly required protection, deportation, N -alkylation and Suzuki coupling reactions. We have optimized all the steps for clean reaction profile and easy isolation of all intermediates and final compounds. The compounds 13a-h and 15a-h are tested for antiproliferative activity on panel of four cell lines. Compounds with pyrimidine-2-yl substitutions and quinolone $3 / 5-\mathrm{yl}$ groups are most active compared with 3-methoxy and benzofurane/benzothiophene. Compounds 13c, 13g, 15g and 15h are tested for panel of eight kinase inhibitors and most of derivatives are mostly active on Aurora-A, Aurora-B, CDK5/P25 and mTOR human kinase inhibitors.
